

HTML

HTML5 is a catch-all term
for a group of emerging
modern web
technologies

Modern web

Html5

Css

Responsive

Javascript

HTML5 is a **collection**
of features.

You decide which
individual features
to add to each project.

2022 ?

HTML5 is a
work in progress

HTML5 is unfinished the same way the English language is unfinished. I like that analogy. [#csforum12](#)

Many HTML5 features
are useable now.

All browsers support
some of HTML5.

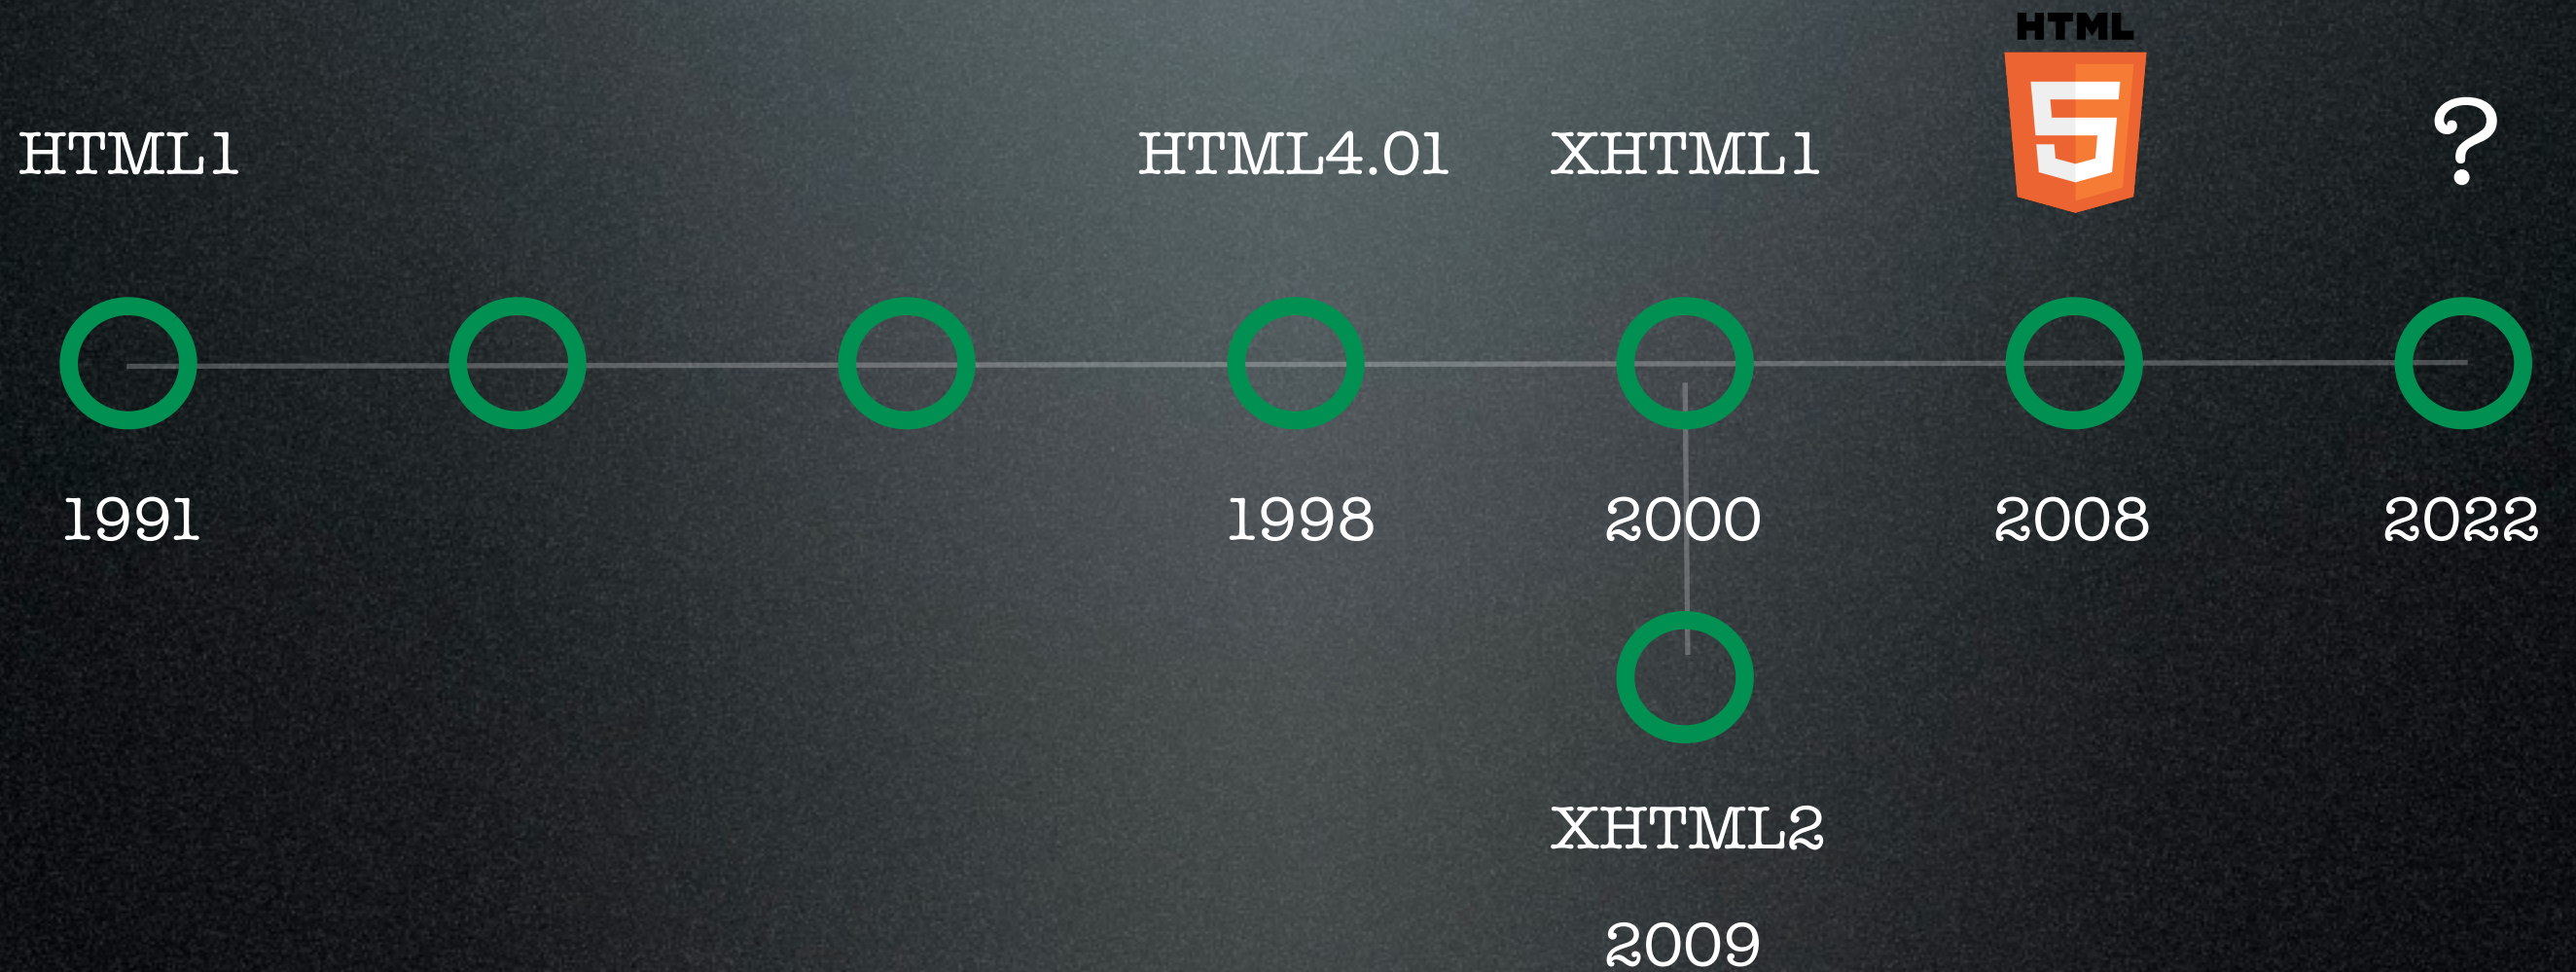

No browser supports
all of HTML5.

Chrome 22 Mac	91%
------------------	-----

IE10	65%
IE9	28%
IE8	8%
IE7	5%
IE6	5%

Evolution

HTML 4.0.1

14 years old

A markup language
for creating **static** pages
viewed on **desktops**

HTML 5

A markup language
for a **dynamic**
and **responsive** web

Javascript

A central part of HTML5.

e.g. `<canvas>`

Pragmatic

Works with existing
HTML4 content.
Looser syntax.

Simpler doctype	_____	<!DOCTYPE html>
Current language	_____	<html lang="en">
Unicode	_____	<meta charset="utf-8">
Stylesheet	_____	<link rel="stylesheet" href="style.css">
		</head>
		<body>
		<h1>HTML5</h1>
Javascript	_____	<script src="code.js"></script>
		</body>
		</html>

Semantic tags

Structural elements
that define parts
of a web page

Meaningful markup

“Good sites need good structure. Pages become more accessible, can be authored more easily, are more maintainable, work better with the browser, are more searchable by Google, provide clear document outlines, lay a foundation for everything else”

Peter Gasston, The Modern Web

A solid structure helps
creation
maintenance
browsers
search engines
accessibility

The new semantic tags may
improves authoring,
readability, accessibility,
and semantic value of the
code produced

In HTML4 we use DIVs.
A lot.

No common vocabulary,
no naming convention

```
<div id="header">
```

```
<div id="hdr">
```

```
<div id="heading">
```

```
<div id="head">
```

html 4

1 system of headings
per page, h1-h6

html 5

Multiple sections/
articles on the same
page can have their
own heading
systems from h1-h6

We want a web page..

to work with search engines,

to work with screen readers,

to be syndicable,

to be readable by software tools

Is there still a use for **DIVs**?

Wrapper divs to centre a page.

As stylistic hooks to style a page
which has no meaning.

html 4

<div>

html 5

<section>

<article>

<nav>

<header>

<footer>

<aside>

<main>

Works in IE6+

```
<!--[if lt IE 9]>  
    <script src="html5shiv.js"></script>  
<![endif]-->
```

```
article,section,nav,aside {  
    display:block;  
}
```

Convert existing pages,
or just new pages?

<section>

A chunk of page content.

`<article>`

Independent cohesive
chunk of content that
can be republished
elsewhere

Sections can contain articles.
Articles can contain sections.

```
<article id="oscars">  
  <section id="nominations">  
    <article id="bestActor">  
      <section>De Niro</section>  
      <section>Al Pacino</section>  
    </article>  
  </section>  
  
  <section id="ceremony">  
    <section>Times</section>  
    <section>Red carpet</section>  
  </section>  
</article>
```

Multiple heading hierarchies on the same page.

```
<section>
  <header>
    <h1>Smith & Jones Ltd.</h1>
  </header>

  <footer>
    <h1>Established 1864</h1>
  </footer>
</section>
```

ARIA roles for accessibility

ARIA Role	HTML5 Element
banner	header
complementary	aside
contentinfo	footer
navigation	nav
article	article
main	N/A

```
<aside role="complementary"> .. </aside>
```

Semantic tags

Search

Republish

Accessibility

Outliner tools

Other new HTML5 elements

`<figure>`
`<figcaption>`

Group an image and
related text.

Custom data attributes

```
<li id="rembrandt"  
  data-full="Rembrandt Harmenszoon van Rijn"  
  data-born="15 July 1606"  
  data-file="details/rembrandt.txt"  
  data-wiki="http://en.wikipedia.org/wiki/Rembrandt" >  
    
</li>
```

Create attributes, prefixed with “data-“ to elements

Video

It works on tablets, phones.
Unlike **Flash**.

`<video>` element has
fallback logic built in
for older browsers

Video is now a 1st class
element on a web page.

Style video with CSS.
Script video with Javascript

CODECs

```
<source src="film.mp4" type="video/mp4">  
<source src="film.ogv" type="video/ogg">
```

Batch convert video formats with MIRO

Subtitles

```
<track src="words.vtt" srclang="en">  
<track src="parole.vtt" srclang="it">
```

WebVTT text file contains
timecodes and localised subtitles.

No copy protection or
digital rights management yet

Drawing

HTML4

Displayed bitmaps,
But lacked dynamic
drawing tools, for data
visualisation

Canvas

index.html

```
<body>
```

```
<canvas>
```

Draw into a
blank slate
using
Javascript.

Canvas

```
<canvas width="200" height="200" >
```

```
<p>Fallback content for older browsers</p>
```

```
</canvas>
```

Canvas

Creates bitmaps

Requires Javascript

Animation

No interactivity

Canvas

Software tools
generate canvas
Javascript
for you.

Combine green/blue screen
video with **canvas**

SVG

SVG creates resolution independent, scalable, vector graphics, stored in XML text files.

SVG?

```
<svg width="40px" height="80px" ></svg>
```

An XML description
of a **scalable vector**.
in a small text file.

Forms

Forms

Form validation without
the need to write
Javascript.

Forms

Form behaviour changes to match the device being used.

Forms

```
<input  
type=email  
placeholder="name@domain.com"  
required  
autofocus>  
</input>
```

Forms

```
pattern="[0-9]{16}"
```

Regular expression style pattern matching for validation.

Only allow a number which is all digits and 16 digits in length

Local storage

Local Storage

Save state of a web page.

Data stored on local HD.

Browser specific.

Domain specific.

Simple values

```
localStorage.today = "Friday";  
console.log( localStorage.today );
```

Store objects

```
var time = { hours:"12" , minutes:"45"};  
localStorage.time = JSON.stringify( time );
```

Retrieve objects

```
var time = JSON.parse( localStorage.time );
```

Appcache

Tell browser to save web
page locally.

Works offline : no
Javascript required.

Geolocation

Geolocation

Find users location on Earth.
Pass longitude, latitude data
onto a service
like GoogleMaps

Geolocation

Public IP address
WIFI
GPS
Cell Towers

```
if (navigator.geolocation) {  
    navigator.geolocation.getCurrentPosition( .. )  
}
```

```
if (navigator.geolocation) {  
    var options = { enableHighAccuracy : true };  
    navigator.geolocation.getCurrentPosition( options )  
}
```

Testing for HTML5 support

caniuse.com
html5please.com

Modernizr.js

Javascript library tests
feature support
on users browser.

Modernizr.js adds classes for support features to `<html>` element. Test these in CSS.

```
<html class="svg canvas">
```

```
.svg button { .. }
```

Test Modernizr support with Javascript

```
if (Modernizr.video) { .. }
```
